The amount of carbon dioxide produced from burning fossil fuels is around 21.3 billion tonnes each year. The earth is only able to take only about half of that, which means that there is a net increase of 10.5 billion tonnes of atmospheric carbon dioxide per year.

Fighting for a greener planet benefits us all! It's time we stand up and take care of the planet that is home for us all.

Making our voices heard is the first step. Change doesn't happen unless you get up and do something about it. Fighting for what you believe in is what will create the change! If we want to fight for a cleaner planet, then we should make our voices heard!
